## Survey Results

Which program are you in?

| A | CS | $\mathbf{4 2 \%}$ |
| :--- | :--- | :--- |
| $\mathbf{B}$ | ECE |  |
| C | Math | $\mathbf{1 0 \%}$ |
| $\mathbf{D}$ | Stats | $\mathbf{1 0 \%}$ |
| $\mathbf{E}$ | Other | $\mathbf{2 8 \%}$ |

Please submit survey in Lesson 1 on edstem if not already.

## Survey Result: Motivation

very popular in industry and current technological breakthroughs.
want to learn about the various applications of deep learning within my everyday life.

Learn more about deep learning and potential applications to my PhD research
plan to go to grad school and study ML/NLP/AI
planning to get an intern in this filed
My main motivation is to learn the basic knowledge of machine learning and apply them for the future use of my startup.

## Recap

- Neural networks began as computational models of the brain
- Neural network models are connectionist machines
- The comprise networks of neural units
- Neural Network can model Boolean functions
- McCullough and Pitt model: Neurons as Boolean threshold units
- Hebb's learning rule: Neurons that fire together wire together
- Rosenblatt's perceptron : A variant of the McCulloch and Pitt neuron with a provably convergent learning rule
- But individual perceptrons are limited in their capacity (Minsky and Papert)
- Multi-layer perceptrons can model arbitrarily complex Boolean functions

## A model for boolean function

## $((A \bar{X} Z) \mid(A \bar{Y}))\left(\left(\begin{array}{ll}X & Y) \mid(\bar{X} Z))\end{array}\right.\right.$

## Neural Network

- A network is a function
- Given an input, it computes the function layer wise to predict an output
- More generally, given one or more inputs, predicts one or more outputs
- Given a labeled dataset $\left\{\left(\mathrm{x}_{\mathrm{n}}, \mathrm{y}_{\mathrm{n}}\right)\right\}$, how to train a model that maps from $x \longrightarrow y$
- Idea: develop a complex model using massive basic simple units

## What is Deep Learning

- Deep learning is a particular kind of machine learning
- that achieves great power and flexibility by representing the world as a nested hierarchy of concepts,
- with each concept defined in relation to simpler concepts, and more abstract representations computed in terms of less abstract ones.

Ian Goodfellow and Yoshua Bengio and Aaron Courville.
Deep Learning, 2016

## What is Machine Learning?

- A computer program is said to learn from experience $E$ with respect to some class of tasks $T$ and performance measure $P$, if its performance at tasks in $T$, as measured by P, improves with experience E"
- [Tom Mitchell, Machine Learning, 1997]

## How to build a Machine Learning system

- Task T:
- What is input and output?
- Experience E:
- What is training data? How to get them easily?
- Performance Measure P
- How to measure success
- Model:
- What is the computational architecture?
- Training:
- How to improve with experience?
- What is the loss?

## Task T

- To find a function f: x -> y
- Classification: label $y$ is categorical
- Regression: label y is continuous numerical
- Example:
- Image classification
- Input space: x in $R^{h \times h \times 3}$ is $\mathrm{h} \times \mathrm{h}$ pixels ( rgb ), so it is a tensor of hxhx 3 .
- Output space: $y$ is $\{1 . .10\}$ in Cifar-10, or $\{1 . .1000\}$ in ImageNet.
- Text-to-Image generation
- Input: x is a sentence in $V^{L}, \mathrm{~V}$ is vocabulary, L is length
- Output: y is $R^{h \times h \times 3}$

## Formulating tasks as ML Problems

## 我很高兴

 am very happy

Hi，Siri，please turn on the light

Cat

## Experience E

- Supervised Learning: if pairs of ( $x, y$ ) are given
- Unsupervised Learning: if only $x$ are given, but not y
- Semi-supervised Learning: both paired data and raw data
- Self-supervised Learning:
- use raw data but construct supervision signals from the data itself
- e.g. to predict neighboring pixel values for an image
- e.g. to predict neighboring words for a sentence

## How Experience is Collected?

- Offline/batch Learning:
- All data are available at training time
- At inference time: fix the model and predict
- Online Learning:
- Experience data is collected one (or one mini-batch) at a time (can be either labeled or unlabeled)
- Incrementally train and update the model, and make predictions on the fly with current and changing model
- e.g. predicting ads click on search engine
- Reinforcement Learning:
- A system (agent) is interacting with an environment (or other agents) by making an action
- Experience data (reward) is collected from environment.
- The system learns to maximize the total accumulative rewards.
- e.g. Train a system to play chess

# Learning w/ various Number of Tasks 

- Multi-task learning
- one system/model to learn multiple tasks simultaneously, with shared or separate Experience, with different performance measures
- e.g. training a model that can detect human face and cat face at the same time
- Pre-training \& Fine-tuning
- Pre-training stage: A system is trained with one task, usually with very large easily available data
- Fine-tuning stage: it is trained on another task of interest, with different (often smaller) data
- e.g. training an image classification model on ImageNet, then finetune on object detection dataset.

## Machine Translation as a Machine Learning Task

- Input (Source)
- discrete sequence in source language, $\mathrm{V}_{\mathrm{s}}$
- Output (Target)
- discrete sequence in target langauge, $\mathrm{V}_{\mathrm{t}}$
- Experience E
- Supervised: parallel corpus, e.g. English-Chinese parallel pairs
- Unsupervised: monolingual corpus, e.g. to learn MT with only Tamil text and English text, but no Eng-Tamil pairs
- Semi-supervised: both
- Number of languages involved
- Bilingual versus Multilingual MT
- Notice: it can be multilingual parallel data, or multilingual monolingual data
- Measure P
- Human evaluation metric, or Automatic Metric (e.g. BLEU), see previous lecture

## Story so far

- Machine learning is the study of machines that can improve their performance with more experience

## Linear Models

## House Buying

- Pick a house, take a tour, and read facts
- Estimate its price, bid

Listing

| $\$ 5,498,000$ | $\mathbf{7}$ | $\mathbf{5}$ | $\mathbf{4 , 8 6 5}$ Sq. Ft. |

Predicte

## Virtual Tour

- Branded Virtual Tour
- Virtual Tour (External Link)

Parking Information

- Garage (Minimum): 2
- Garage (Maximum): 2
- Parking Description: Attached Garage, On Street
- Garage Spaces: 2

Multi-Unit Information

- \# of Stories: 2

School Information

- Elementary School: EI C
- Elementary School Dist
- Middle School: Jane Lat
- High School: Palo Alto H
- High School District: Pa

## Interior Features

## Bedroom Information

- \# of Bedrooms (Minimum): 7
- af Radranma IMAovimumi. 7
- Kitchen Description: Co Dishwasher, Garbage Di Island with Sink. Microw

## House Price Prediction

Very important, that's real money...
\$100K+

## What A paid

## What B paid

Price

Redfin overestimated the price, and $B$ believed it

## Discussion

- How to predict the price of a house unit?

## A Simplified Model

- Assumption 1

The key factors impacting the prices are \#Beds, \#Baths, Living Sqft, denoted by
$x_{1}, x_{2}, x_{3}$

- Assumption 2

The sale price is a weighted sum over the key factors $y=w_{1} x_{1}+w_{2} x_{2}+w_{3} x_{3}+b$

Weights and bias are determined later

## Linear Model (Linear Regression)

- Given $n$-dimensional inputs
$\mathbf{x}=\left[x_{1}, x_{2}, \ldots, x_{n}\right]^{T}$
- Linear model has a $n$-dimensional weight and a bias

$$
\begin{gathered}
\mathbf{w}=\left[w_{1}, w_{2}, \ldots, w_{n}\right]^{T}, \quad b \\
y=w_{1} x_{1}+w_{2} x_{2}+\ldots+w_{n} x_{n}+b
\end{gathered}
$$

- The output is a weighted sum of the inputs

$$
y=\langle\mathbf{w}, \mathbf{x}\rangle+b
$$

Vectorized version

## Linear Model as a Single-layer Neural Network

Output

Input

## Measure Estimation Quality

- Compare the true value vs the estimated value
Real sale price vs estimated house price
- Let $y$ the true value, and $\hat{y}$ the estimated value, we can compare the loss

$$
\ell(y, \hat{y})=(y-\hat{y})^{2}
$$

It is called squared loss

## Training Data

- Collect multiple data points to fit parameters Houses sold in the last 6 months
- It is called the training data
- The more the better
- Assume n examples $D=\left\{\left\langle x_{n}, y_{n}\right\rangle\right\}$

$$
\begin{aligned}
& \mathbf{X}=\left[\mathbf{x}_{0}, \mathbf{x}_{1}, \ldots, \mathbf{x}_{n}\right]^{T} \\
& \mathbf{y}=\left[y_{0}, y_{1}, \ldots, y_{n}\right]^{T}
\end{aligned}
$$

## Training Objective

- Training loss

$$
\ell(\mathbf{X}, \mathbf{y}, \mathbf{w}, b)=\frac{1}{n} \sum_{i=1}^{n}\left(y_{i}-\left\langle\mathbf{x}_{i}, \mathbf{w}\right\rangle-b\right)^{2}=\frac{1}{n}\|\mathbf{y}-\mathbf{X} \mathbf{w}-b\|^{2}
$$

- Minimize loss to learn parameters

$$
\mathbf{w}^{*}, \mathbf{b}^{*}=\arg \min _{\mathbf{w}, b} \ell(\mathbf{X}, \mathbf{y}, \mathbf{w}, b)
$$

## Norm

- A "distance" metric
- 11 norm

$$
-\|x\|_{1}=\left|x_{1}\right|+\left|x_{2}\right|+\cdots
$$

- 12 norm

$$
-\|x\|=\sqrt{x_{1}^{2}+x_{2}^{2}+\cdots}
$$

- lp norm

$$
-\|x\|_{p}=\left(x_{1}^{p}+x_{2}^{p}+\cdots\right)^{\frac{1}{p}}
$$

## Closed-form Solution

- Add bias into weights by

$$
\mathbf{X} \leftarrow[\mathbf{X}, \mathbf{1}] \quad \mathbf{w} \leftarrow\left[\begin{array}{l}
\mathbf{w} \\
b
\end{array}\right]
$$

$$
\ell(\mathbf{X}, \mathbf{y}, \mathbf{w})=\frac{1}{n}\|\mathbf{y}-\mathbf{X} \mathbf{w}\|^{2} \frac{\partial}{\partial \mathbf{w}} \ell(\mathbf{X}, \mathbf{y}, \mathbf{w})=\frac{2}{n}(\mathbf{y}-\mathbf{X} \mathbf{w})^{T} \mathbf{X}
$$

- Loss is convex, so the optimal solutions satisfies

$$
\begin{aligned}
& \frac{\partial}{\partial \mathbf{w}} \ell(\mathbf{X}, \mathbf{y}, \mathbf{w})=0 \\
\Leftrightarrow & \frac{2}{n}(\mathbf{y}-\mathbf{X} \mathbf{w})^{T} \mathbf{X}=0 \\
\Leftrightarrow & \mathbf{w}^{*}=\left(\mathbf{X}^{T} \mathbf{X}\right)^{-1} \mathbf{X}^{T} \mathbf{y}
\end{aligned}
$$

## Matrix Calculus

## Gradients

## - Generalize derivatives into vectors

## Gradients of vector functions

$$
\begin{aligned}
& \mathbf{x}=\left[\begin{array}{c}
x_{1} \\
x_{2} \\
\vdots \\
x_{n}
\end{array}\right] \quad \nabla y=\frac{\partial y}{\partial \mathbf{x}}=\left[\frac{\partial y}{\partial x_{1}}, \frac{\partial y}{\partial x_{2}}, \ldots, \frac{\partial y}{\partial x_{n}}\right] \\
& y=x_{1}^{2}+2 x_{2}^{2} \\
& \frac{y}{\partial} \\
& \frac{\partial}{\mathbf{x}} x_{1}^{2}+2 x_{2}^{2}=\left[2 x_{1}, 4 x_{2}\right]
\end{aligned}
$$

Direction (2, 4), perpendicular to the contour lines

## Examples

$$
\begin{array}{c|ccccc}
y & a & a u & \operatorname{sum}(\mathbf{x}) & \|\mathbf{x}\|^{2} & a \text { is not a function of } \mathbf{x} \\
\hline \frac{\partial y}{\partial \mathbf{x}} & \mathbf{0}^{T} & a \frac{\partial u}{\partial \mathbf{x}} & \mathbf{1}^{T} & 2 \mathbf{x}^{T} & \mathbf{0} \text { and } \mathbf{1} \text { are vectors } \\
y & u+v & u v & \langle\mathbf{u}, \mathbf{v}\rangle \\
\hline \frac{\partial y}{\partial \mathbf{x}} & \frac{\partial u}{\partial \mathbf{x}}+\frac{\partial v}{\partial \mathbf{x}} & \frac{\partial u}{\partial \mathbf{x}} v+\frac{\partial v}{\partial \mathbf{x}} u & \mathbf{u}^{T} \frac{\partial \mathbf{v}}{\partial \mathbf{x}}+\mathbf{v}^{T} \frac{\partial \mathbf{u}}{\partial \mathbf{x}}
\end{array}
$$

## Gradients of vector functions

$\partial y / \partial \mathbf{x}$ is a row vector, while $\partial \mathbf{y} / \partial x$ is a column vector
It is called numerator-layout notation. The reversed version is called denominator-layout notation
$\mathbf{x} \in \mathbb{R}^{n}, \quad \mathbf{y} \in \mathbb{R}^{m}, \quad \frac{\partial \mathbf{y}}{\partial \mathbf{x}} \in \mathbb{R}^{m \times n}$ $\partial \mathbf{y} / \partial \mathbf{x}\left[\begin{array}{c}x_{1} \\ x_{2} \\ \vdots \\ x_{n}\end{array}\right]$

$\frac{\partial \mathbf{y}}{\partial \mathbf{x}}=\left[\begin{array}{c}\frac{\partial y_{1}}{\partial \mathbf{x}} \\ \frac{\partial y_{2}}{\partial \mathbf{x}} \\ \vdots \\ \frac{\partial y_{m}}{\partial \mathbf{x}}\end{array}\right]=\left[\begin{array}{c}\frac{\partial y_{1}}{\partial x_{1}}, \frac{\partial y_{1}}{\partial x_{2}}, \ldots, \frac{\partial y_{1}}{\partial x_{n}} \\ \frac{\partial y_{2}}{\partial x_{1}}, \frac{\partial y_{2}}{\partial x_{2}}, \ldots, \frac{\partial y_{2}}{\partial x_{n}} \\ \vdots \\ \frac{\partial y_{m}}{\partial x_{1}}, \frac{\partial y_{m}}{\partial x_{2}}, \ldots, \frac{\partial y_{m}}{\partial x_{n}}\end{array}\right]$

## Examples

| $\mathbf{y}$ | $\mathbf{a}$ | $\mathbf{x}$ | $\mathbf{A x}$ | $\mathbf{x}^{T} \mathbf{A}$ |
| :---: | :---: | :---: | :---: | :---: |
| $\frac{\partial \mathbf{y}}{\partial \mathbf{x}}$ | $\mathbf{0}$ | $\mathbf{I}$ | $\mathbf{A}$ | $\mathbf{A}^{T}$ |

$\mathbf{x} \in \mathbb{R}^{n}, \quad \mathbf{y} \in \mathbb{R}^{m}, \quad \frac{\partial \mathbf{y}}{\partial \mathbf{x}} \in \mathbb{R}^{m \times n}$
$a$, a and $\mathbf{A}$ are not functions of $\mathbf{x}$
0 and I are matrices

| $\mathbf{y}$ | $a \mathbf{u}$ | $\mathbf{A u}$ | $\mathbf{u}+\mathbf{v}$ |
| :---: | :---: | :---: | :---: |
| $\frac{\partial \mathbf{y}}{\partial \mathbf{x}}$ | $a \frac{\partial \mathbf{u}}{\partial \mathbf{x}}$ | $\mathbf{A} \frac{\partial \mathbf{u}}{\partial \mathbf{x}}$ | $\frac{\partial \mathbf{u}}{\partial \mathbf{x}}+\frac{\partial \mathbf{v}}{\partial \mathbf{x}}$ |

# Generalize to Matrices 

Scalar Vector Matrix
$x(1,) \quad \mathbf{X}(n, 1) \quad \mathbf{X}(n, k)$
Scalar $\quad y(1,) \quad \frac{\partial y}{\partial x}(1,) \quad \frac{\partial y}{\partial \mathbf{x}}(1, n) \quad \frac{\partial y}{\partial \mathbf{X}}(k, n)$
Vector $\mathbf{y}_{(m, 1)} \quad \frac{\partial \mathbf{y}}{\partial x}(m, 1) \quad \frac{\partial \mathbf{y}}{\partial \mathbf{x}}(m, n) \quad \frac{\partial \mathbf{y}}{\partial \mathbf{X}} \quad(m, k, n)$
Matrix $\mathbf{Y}_{(m, l)} \frac{\partial \mathbf{Y}}{\partial x}{ }_{(m, l)} \quad \frac{\partial \mathbf{Y}}{\partial \mathbf{x}} \quad(m, l, n) \quad \square \frac{\partial \mathbf{Y}}{\partial \mathbf{X}} \square(m, l, k, n)$

## Generalize to Vectors

$$
y=f(u), u=g(x) \quad \frac{\partial y}{\partial x}=\frac{\partial y}{\partial u} \frac{\partial u}{\partial x}
$$

$$
\begin{array}{llll}
\frac{\partial y}{\partial \mathbf{x}}=\frac{\partial y}{\partial u} \frac{\partial u}{\partial \mathbf{x}} & \frac{\partial y}{\partial \mathbf{x}}=\frac{\partial y}{\partial \mathbf{u}} \frac{\partial \mathbf{u}}{\partial \mathbf{x}} & \frac{\partial \mathbf{y}}{\partial \mathbf{x}}=\frac{\partial \mathbf{y}}{\partial \mathbf{u}} \frac{\partial \mathbf{u}}{\partial \mathbf{x}} \\
(1, n) & (1,)(1, n) & (1, n) & (1, k)(k, n) \\
(m, n)(m, k)(k, n)
\end{array}
$$

## Example 1

Assume $\mathbf{x}, \mathbf{w} \in \mathbb{R}^{n}, \quad y \in \mathbb{R}$

$$
\frac{\partial \mathbf{y}}{\partial \mathbf{x}}=\frac{\partial \mathbf{y}}{\partial \mathbf{u}} \frac{\partial \mathbf{u}}{\partial \mathbf{x}}
$$

$$
z=(\langle\mathbf{x}, \mathbf{w}\rangle-y)^{2}
$$

Compute $\frac{\partial z}{\partial \mathbf{w}}$

$$
\begin{aligned}
\frac{\partial z}{\partial \mathbf{w}} & =\frac{\partial z}{\partial b} \frac{\partial b}{\partial a} \frac{\partial a}{\partial \mathbf{w}} \\
& =\frac{\partial b^{2}}{\partial b} \frac{\partial a-y}{\partial a} \frac{\partial\langle\mathbf{x}, \mathbf{w}\rangle}{\partial \mathbf{w}} \\
& =2 b \cdot 1 \cdot \mathbf{x}^{T} \\
& =2(\langle\mathbf{x}, \mathbf{w}\rangle-y) \mathbf{x}^{T}
\end{aligned}
$$

## Solving Linear Model

$\hat{w}=\arg \min \|\mathbf{X w}-\mathbf{y}\|^{2}$

$$
\frac{\partial \mathbf{y}}{\partial \mathbf{x}}=\frac{\partial \mathbf{y}}{\partial \mathbf{u}} \frac{\partial \mathbf{u}}{\partial \mathbf{x}}
$$

Assume $\mathbf{X} \in \mathbb{R}^{m \times n}, \quad \mathbf{w} \in \mathbb{R}^{n}, \quad \mathbf{y} \in \mathbb{R}^{m}$

$$
\begin{aligned}
\frac{\partial z}{\partial \mathbf{w}} & =\frac{\partial z}{\partial \mathbf{b}} \frac{\partial \mathbf{b}}{\partial \mathbf{a}} \frac{\partial \mathbf{a}}{\partial \mathbf{w}} \\
& =\frac{\partial\|\boldsymbol{b}\|^{2}}{\partial \mathbf{b}} \frac{\partial \mathbf{a}-\mathbf{y}}{\partial \mathbf{a}} \frac{\partial \mathbf{X} \mathbf{w}}{\partial \mathbf{w}} \\
& =2 \mathbf{b}^{T} \times \mathbf{I} \times \mathbf{X} \\
& =2(\mathbf{X} \mathbf{w}-\mathbf{y})^{T} \mathbf{X}
\end{aligned}
$$

Let

$$
\begin{gathered}
2(\mathbf{X w}-\mathbf{y})^{T} \mathbf{X}=0 \\
\mathbf{w}^{*}=\left(\mathbf{X}^{T} \mathbf{X}\right)^{-1} \mathbf{X}^{T} \mathbf{y}
\end{gathered}
$$

## Optimality Condition for Convex Function

. How to find $\arg \min f(\theta)$
$\theta$
. Optimal $\theta^{*}$ satisfies $\nabla f=\frac{\partial f}{\partial \theta}=0$

## More about matrix calculus

- http://www2.imm.dtu.dk/pubdb/edoc/ imm3274.pdf

## Quiz

- https://edstem.org/us/courses/31035/ lessons/52853/slides/301922

## Linear model in PyTorch

import torch
from torch.autograd import Variable
class linearRegression(torch.nn.Module):
def __init__(self, inputSize, outputSize): super(linearRegression, self):__init_() self.linear = torch.nn.Linear(inputSize, outputSize)
def forward(self, x): out = self.linear(x) return out

## Recap

- Machine learning is the study of machines that can improve their performance with more experience
- Linear Regression Model
- Output is linearly dependent on the input variables
- Minimize squared loss

## Next Up

- Classification: Logistic Regression
- Multilayer Perceptron
- More on neural networks as universal approximators
- And the issue of depth in networks
- How to train neural network from data
